an electronic reading means at central clearing house preferably provides for a use of a scanner capable of reading both visible data and the data printed with invisible or substantially invisible print. Moore teaches that there is provided a means for identifying to a transacting financial institution whether actual identification of the maker was made at the time of transaction. Moore further discloses that the process employed for verification of authenticity at central clearing house involves comparison of the characteristics of the visible and invisible marks with each other and with information relating to valid marks stored in data processing means

However, Moore does not teach all the specific steps of a protection method to avoid acceptance of a fraudulent check at the point and time of transaction between a merchant and a check writer, wherein the method includes determining by the merchant whether to accept or refuse the check at the point and time of transaction based on all the comparing steps recited in the claim.
